

Adolescent Weight-Loss Surgery

Ryan, whose 100-pound weight-loss from bariatric surgery as a teen eliminated his Type II diabetes

The teen years can be especially hard for young patients dealing with weight-related health and social issues. We understand and also know that obesity can be difficult to treat with diet and exercise alone. That's why we offer a weight-loss surgery program especially for teens ages 15-17*. Our goal is to help teens with obesity achieve healthier and more active lives.

While bariatric surgery is not for everyone, if it's the right option for your patient, our team of experts can help. We offer comprehensive care for the adolescent's complete physical and mental well-being.

Eligibility

- Ages 15-17*
- Body Mass Index (BMI) of 40 or greater
- BMI of 35-39 with other significant comorbidities
- Failure to lose weight with physician-guided diets and exercise

**With parental consent*
